

Pointers (Computer Science) - Quick Notes

- A pointer is a variable that stores the memory address of another variable.
- Declared using * symbol (example: `int *ptr`).
- `&` (address-of operator) gets the address of a variable.
- `*` (dereference operator) accesses the value at the address.
- Example:
 `int x = 10;`
 `int *p = &x; // p stores address of x`
 `*p = 20; // changes value of x to 20`
- Pointers are useful for dynamic memory, arrays, and functions.
- Be careful: uninitialized pointers can cause errors (dangling pointers).
